

Wesley Family Services

Executive Summary

Client

Aaron Richards, James Shaner, Kendell Berry

Student Consulting Team

Daniel Contreras, Yuqi Zou, Yuxiang Huang

Background

Wesley Family Services is a nonprofit organization based in Western Pennsylvania that provides behavioral healthcare and therapeutic support services to children, adults, and families. Formed in 2017 by the merger of Wesley Spectrum and Family Services of Western Pennsylvania, the organization operates under its **Quality Whole Person Care Model®**, a holistic approach that focuses on addressing the full range of an individual's needs through person-centered services.

Project Description

Project Opportunity

The existing account creation workflow relied on a CSV-based process that created inefficiencies in reliability and accessibility. File-based data transfers increased the likelihood of errors and required frequent technical intervention, resulting in onboarding times ranging from 45 minutes to 2 hours. These limitations also restricted non-technical staff from participating in the process and created unnecessary dependence on IT support.

Project Vision

The project proposed modernizing the existing account creation workflow by replacing the CSV-based process with a more structured and accessible system. The solution focused on integrating a centralized database and enhancing the organization's internal website to provide staff with a more reliable and transparent interface for managing account data, thus waiving the need for IT tickets during onboarding and standardizing onboarding time to 45 minutes. Alternative approaches, such as using a shared Excel-based system, were considered but ultimately rejected.

Project Outcomes

The project transitioned the account creation workflow from a CSV-based system to a centralized Microsoft SQL Server database, improving reliability, auditability, and long-term data management while maintaining compatibility with existing PowerShell scripts. Enhancements to the internal website introduced an administrative module that allows staff to track onboarding status, manage account records, and resolve common issues independently. A password

generation feature was also implemented to ensure each account receives a unique passphrase when it's first created, improving security and consistency in the onboarding process.

Deliverables

The project produced deliverables supporting both implementation and long-term maintenance, including the account creation automation scripts and the enhanced self-service portal hosted in dedicated GitHub repositories with supporting documentation. Additional deliverables included updates to portal documentation and a structured knowledge handoff to internal staff to ensure the system remains maintainable and extensible.

Risks and Limitations

Although the solution was designed for long-term maintainability, several risks and limitations remain. While rollback functionality allows non-technical staff to reset accounts, when necessary, it does not eliminate the possibility of automation script failures. In addition, the effectiveness of the new workflow depends on organizational adoption, as staff may continue using the previous ticket-based process instead of the self-service portal.

Recommendations

Developing a mobile-accessible module would allow IT staff to perform key administrative tasks, such as account creation, rollbacks, and account management, without requiring desktop access, enabling faster responses to operational requests. Additionally, the centralized database creates an opportunity to integrate reporting tools such as SQL Server Reporting Services (SSRS) to generate onboarding metrics and operational insights.

About The Team

Daniel Contreras is a senior in Information Systems with a minor in Business Administration and a concentration in Business Analytics. He served as the client point of contact, coordinating and documenting meetings, producing written deliverables, and ensuring the team and Aaron – the client POC – were on the same page.

Yuqi Zou is a senior in Information Systems with a concentration in Software and Systems. Yuqi served as the team's co-head of QA and Risk and led the development of the new website tab, implementing the Account Management module with search, add, and rollback functionality, AD group-based authorization, and a passphrase-style password generator across both the frontend and backend.

Yuxiang Huang is a junior in Information Systems with an additional major in Computer Science. Yuxiang served as the team's co-head of QA and Risk and led the migration of the account creation scripts' data source from CSV files to a SQL Server database.
