Background

Health Habits is a rapidly growing Pittsburgh non-profit based in Pittsburgh focused on improving wellness outcomes for youth and older adults in underserved communities. Through programs that combine physical activity, nutrition education, mentorship, and social connection, the organization delivers culturally rooted, community-driven health initiatives. The organization's operations is managed by a small team and has increasingly relied on digital tools such as Google Forms and spreadsheets to manage operations, track participation, and communicate impact to stakeholders.

Project Description

Project Opportunity

Health Habits' existing workflows are highly manual and fragmented across multiple tools. Staff must repeatedly re-enter participant information, reconcile attendance records, and manage communication through individual texts and emails. Data for participants, volunteers, and donors is stored across disconnected spreadsheets, resulting in duplication, inefficiencies, and difficulty generating accurate, grant-ready reports. These challenges limit the organization's ability to scale, reduce time available for program delivery, and hinder its capability to secure funding through clear and reliable impact reporting.

Project Vision

This project aimed to design a centralized, automated system within Google Workspace that integrates registration, attendance, and donor tracking into a unified workflow. The solution prioritized affordability, ease of use, and alignment with existing tools while reducing manual processes and improving data organization.

Project Outcomes

The team designed and implemented a centralized system for registration, attendance, and donor tracking using Google Sheets, Google Forms, and Google Apps Script. The system integrates participant data with automated attendance tracking through date-specific tabs and matches users across records, reducing manual reconciliation and duplicate data entry. A donor tracking system was also implemented to automatically log and update donation activity. These changes standardized previously fragmented workflows, creating a more

consistent and efficient process for managing participant and donor data. For Healthy Habits staff, the system reduces administrative burden and aligns with their existing tools, making it easy to adopt and maintain. Overall, the solution improves data reliability, streamlines operations, and supports more sustainable day-to-day program management.

Project Deliverables

The team delivered a comprehensive, low-cost system to support Healthy Habits' operations, including an integrated attendance and registration workflow, a lightweight donor tracking system, and supporting automation scripts built within Google Workspace. These deliverables centralize participant and donor data, automate key processes such as attendance logging and donation tracking, and reduce manual administrative effort. In addition, the team provided detailed documentation, training materials, and system architecture diagrams to ensure ease of use, transparency, and long-term sustainability, enabling Healthy Habits to maintain and build upon the system with minimal technical expertise.

Recommendations

Based on the project outcomes and remaining opportunities, the consulting team recommends implementing automated communication workflows to further enhance efficiency and engagement. First, integrating automated texting campaigns within EZ Texting would streamline participant communication by organizing responses through keyword-based campaigns tied to registration and attendance, reducing manual tracking and improving attendance visibility. Second, implementing an automated donor follow-up system using Google Apps Script would enable proactive outreach to lapsed donors by leveraging centralized donor data, reducing manual effort while improving consistency in communication. Together, these solutions would shift Healthy Habits' operations from manual and reactive processes to more automated and proactive systems, ultimately improving participant engagement, donor retention, and overall organizational efficiency.

Student Consulting Team

Annika Santhanam served as the primary developer of the registration workflows, linking Apps Scripts with Google Forms and Google Sheets to automate the registration process and reduce duplication of information. She is a junior in Information Systems with minors in Cybersecurity & International Conflict and Politics & Public Policy. She is working to go into cybersecurity as her career progresses.

Yining He took the lead for automating attendance workflows and supported project documentation. She is a senior in Information Systems with an additional major in Human-Computer Interaction. She will be continuing her education in Masters in AI Systems Management at CMU.

Evan Cen lead the Donor side CRM automation and was also responsible for sending agendas to the project advisor before advisor meetings and taking notes during those meetings. He will be interning as a software developer at Coinbase in the coming summer and will be looking to graduate in Spring 2027.
