Background

Future Kings Mentoring (FKM) is a Pittsburgh-based nonprofit organization whose mission is to support Black and Brown male youth in developing positive self-identity, leadership skills, and long-term personal growth. FKM delivers this mission through structured mentoring programs that use relatable topics such as music, sports, and media to facilitate discussions on identity, education, financial literacy, and career pathways. The organization serves middle and high school students through monthly mentoring sessions and school-based programs, and relies on a combination of individual donors, foundation grants, and fundraising events to support its operations.

Project Description

Project Opportunity

FKM's website lacked a clear directional flow, making it difficult for students, families, and donors to find and complete key actions such as applying to the program or donating. Donor data collected through Zeffy was not integrated into Salesforce, limiting the organization's ability to track and engage with supporters. Additionally, over 298 workshop presentations stored in SharePoint required manual searching, increasing the risk of duplicating work and consuming significant staff time.

Project Vision

The project aimed to improve FKM's digital infrastructure across three areas: a redesigned website with a structured user flow, an automated donor data pipeline from Zeffy into Salesforce, and a searchable catalog service for workshop presentations. Each solution was designed to minimize cost, reduce technical overhead, and remain maintainable by non-technical staff using tools FKM already had access to.

Project Outcomes

The website redesign established a structured user flow that routes every page toward one of three endpoints (Application, Donate, and Contact Us) ensuring visitors are never more than a few clicks away from taking action. While the redesigned pages are complete in layout and structure, deployment is pending FKM providing updated images/icons/videos to replace

outdated ones. FKM leadership can now independently manage and update the site using Squarespace without technical support, and documentation was provided to support future staff transitions.

The Zeffy-to-Salesforce automation replaced a manual data entry process with a repeatable monthly workflow using Make and SharePoint. The automation is expected to save approximately 5 hours per month and ensures donor records are consistently reflected in Salesforce, supporting more effective donor relationship management.

The catalog service deployed on Azure App Service allows FKM staff to search 298 workshop presentations by theme, audience, and semantic topic using plain language. This eliminates the need for manual file searches and prevents duplication of content creation, estimated to save days of work per MOU cycle.

Project Deliverables

The team delivered a fully redesigned Squarespace website, complete in layout, user flow, and structure, pending final image updates before deployment. A Make flow automates the monthly Zeffy donor import into Salesforce via SharePoint. A web-based catalog service provides semantic search and Excel export for FKM's workshop presentations. Supporting documentation for all three deliverables was provided on FKM's SharePoint for both staff and future developers.

Recommendations

For the website, FKM should provide updated high-quality images so the redesigned pages can be deployed, ensure every new page added in the future is mapped to one of the three established endpoints, and designate a team member to own ongoing website maintenance. For the Zeffy automation, FKM should run the import monthly as a standard administrative task and consider extending the workflow to cover other donation sources such as Venmo and Zelle. For the catalog service, FKM should monitor Azure usage and costs monthly to prevent unexpected charges, and future developers should consider adding an MOU-based workshop planning feature that matches required topics to existing presentations.

Student Consulting Team

Alex Cheung served as the lead developer of the Zeffy-to-Salesforce automation and the catalog service. He is a third-year student majoring in Information Systems with a minor in Computer Science. He will be working at Databricks full-time as a software engineer.

Jose Lima served as the designer and developer of the website redesign. He is a third-year Information Systems major with minors in Computer Science and Game Design at Carnegie Mellon University, graduating May 2027, with career interests in software engineering and game development.

Mason Brownrigg served as the product feedback lead, managing client meetings and coordinating design iterations. He is a third-year Information Systems major with a minor in Product Management at Carnegie Mellon University, graduating May 2027, and will be joining Capital One as a Product Manager Intern.
